a Analysis populations
C0 117 datasets assembled
C1 110 runs completed
C2 93 analysis set | 17 source families
C3 80 on a common step grid
C4 16 strict long-run re-run | 7 families
C5 9 exact-transport re-run | 5 families
control samples (not nested):
34 disconnected of C2 re-run for V_{within} | 25 sham pairs, 8 families | 5 surgery pairs, 2 families
synthetic sweeps: 2 transitivity bases, 4 assortativity bases
primary = >=8 families; exploratory = <5 families
b Ladder of controls
L4 V_G^* characterisation not reached
L3 step-size / horizon controls tested
L3 exact transport + extended horizon tested
L2 scale-equivariant schedule tested
L2 solver tolerance / precision tested
L2 ε-sensitivity tested
L1 operational stopping criterion stopping criterion/variance rule
L1 raw finite-time residual $V(T)$ residual usually reported
each rung removes one non-geometric explanation
