a median over 80 networks
t = 0.5
(10 steps)
variance ratio $V(t) = \sigma^2(t)/\sigma^2(0)$
flow step
b residual (upper bounds)
median = 0.203
strict re-run (n=16)
networks
$\log_{10}$ residual V
c curvature-edge mapping destroyed
21/21 pairs, $p = 4.8e-07$
finite-horizon residual $V(T)$
real flow
sham flow
d old rule measured elapsed time
median -24.7%
n=28: 27/28 falling over the final quarter, 26/28 at the last step
runs labelled saturated
variance change over final quarter (%)
e two fates
converging (n=11)
stalled (n=4)
undecided (n=1)
residual V
late-time decay rate $|r|$ (per step)
f weight spread (p=0.04)
weight spread w_{max}/w_{min}
converging
stalled
